Cabinets for power distribution

When working in aggressive environments, not only automation equipment, but also power equipment needs to be protected.

Ilinox has developed a kit of accessories and specific enclosures for power distribution.

A set of panels and brackets allow to build up a distribution system, hosting standard modular switches and electromechanical components.

Slotted panels allow to reach the components, and glass double doors guarantee visibility without

loss of protection.

Width and depth of cabinets are standard, and height is modular, so as to correctly select the size of the enclosures.

An additional value is that the stainless steel panels are dimensionally compatible with the plastic panels of the major producers. This allows the client to minimize cost of the system, while keeping the degree of protection (with the door closed!).
