## SRS Mounting system

Stainless steel is an expensive material. Smaller cabinets would mean smaller costs.

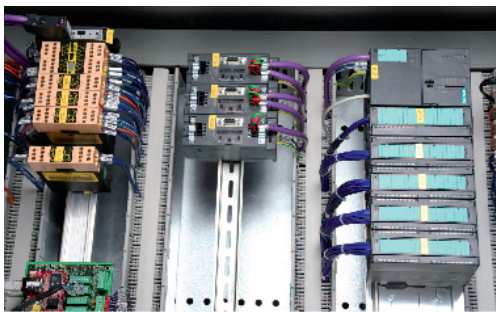

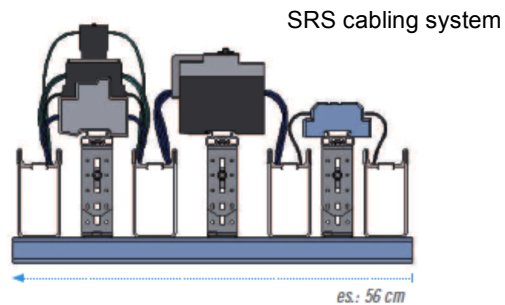

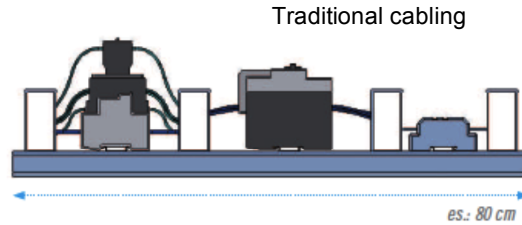

More in general, volume is cost: shipping cost, warehouse cost, room cost for the finished machine.

Innox has developed a solution to improve the utilization of the internal space of the cabinet, so ensuring a reduction of the overall cost.

The SRS mounting system is a very cheap kit of components, which allows to make use of the third dimension in cabling.

A set of bars is mounted on appropriate columns, so that the cables are partly located *under* the components, instead of on the side. Result is a space saving up to 30%.

The system is made out of cheap mechanical components, allowing to organize the cabling on the three dimensions:

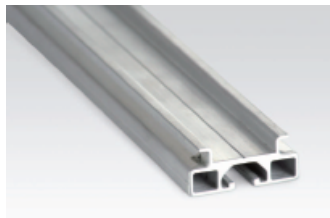

Mounting brackets (of regulable height) allow to mount DIN or universal bars at a defined height

A set of DIN bars and of universal bars host the electrical components

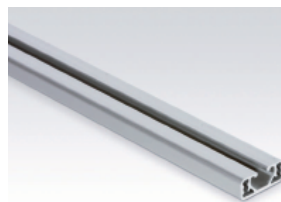

Plastic cable channels with access from above allow to orderly plan the cable disposition.

Mounting bracket
