### Wall mounting kit

Once you have the cabinet, you have to connect it with your machine or plant.

And while this is a straightforward operation in normal environment, if you are using stainless steel enclosures, then your environment is not a normal one.

Welding, boring or punching holes, all these operations affect and damage the protection degree, the chemical stability of the surfaces, the cleanliness of the cabinet and, consequently, of the equipment.

Ilinox supplies its enclosures with the necessary fittings to solve these problems.

4 four holes are pre-drilled in production, and are used both for the internal fixing of the mounting plate, and for the external fixing of the wall-mounting gaskets.

The hole and the screw are designed so as not to protrude over the rear surface of the cabinet.

In this way, the enclosure can be mounted without any gap to the wall, thus ensuring protection against infiltration or deposit of water or dirt.

The brackets are in AISI 316 steel, in order not to become the weak link of the protection.

Brackets can be independently oriented vertically or horizontally.
